

High Speed

Wireless Internet

Welcome to hereUare

The best way to connect to the Internet
when you are outside

hereUare Communications, Inc. is

helping to create and accelerate a major new industry, which is 'For-pay' public and private wireless network. Our services makes it easy for end-users to roam on hereUare's partners' wireless networks through hereUare's unique business model, which leverages all industry participants in a win-win relationship by bringing network operators together with customer owners through a partner-configurable business exchange.

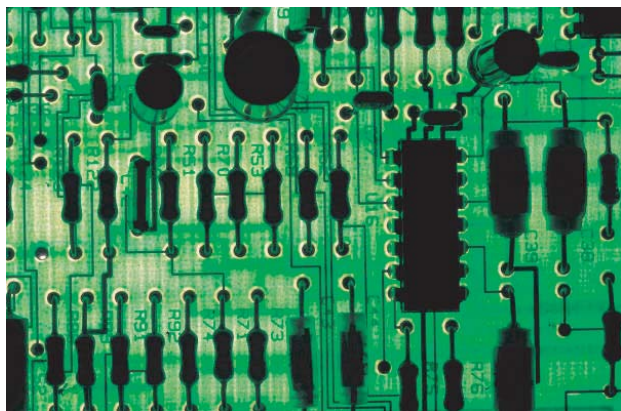

hereUare's Wi-Fi/WiMax enabled wireless broadband solutions can be deployed for Commercial, Enterprise, Educational Institutions (Schools and Universities) and Multi-Tenant property owners, operators and developers. By integrating a hardware unit with an Enterprise scalable web based software solution along with a set of relevant services, such as email, calendar, etc, hereUare solutions increases productivity of users by providing Internet wireless access.

hereUare's affiliate network is currently based on 802.11 technology, a widely adopted standard also referred to as Wi-Fi/WiMax or Wireless LAN.

hereUare Technology:

hereUare Technology consists of two major components all working together to provide value to customer environments.

These components are:

eCoinBox™: The patent pending centerpiece of the hereUare network system is a solid state, highly integrated, small footprint and low cost access controller. This low cost device is deployed at every independent location to control on-site hardware, such as access points and wired Ethernet ports. Further, the eCoinBox™ has the capability to attach local printers, storage devices and computers in a secure zone and communicates with the hereUare's Backoffice for authentication, authorization, accounting, billing, security, encryption and roaming features.

hereUare's Backoffice: hereUare's Backoffice consists of the Operations Support System (OSS) that is centrally installed to allow all eCoinBoxes to be managed remotely and is responsible for all billing, administration and configuration of tasks. Architecturally, the Backoffice consists of an Access Server and a Commerce Server and is responsible for managing the complete network infrastructure.

hereUare's Backoffice application within the Commerce server consists of two main sections, namely the Partner Administration and the Customer Resource Center (CRC). The Partner Administration is responsible for System Management, Account Management, Access Management and for Pricing and Reports, whereas the CRC provides the capability for hereUare Administrators, Partners and Customers to manage their accounts and billing tasks.

hereUare Solutions:

Once the location is "live", users equipped with an 802.11 (Wi-Fi/WiMax) wireless access card in their laptops simply click on their browser to initiate wireless Internet access. The eCoinBox™ enabled access point intercepts the browser's request and, instead of loading their home page loads a welcome log-in page specific to the access provider. From this page, new users can register for service and registered users can log in. Once the user successfully logs in, their original home page is shown. Behind the scenes, the eCoinBox™ communicates with the hereUare back office infrastructure, to complete all the required backoffice functions.

Perfect for:

- Enterprises
- Universities & Schools

- Hotels and Motels
- Apartments & Condos
- Commercial & Retail HotSpots

An Enterprise Solution:

hereUare currently offers three categories of wireless network services, providing Access, Aggregation, and Private Label/Billing capabilities that enable the expansion of wireless access to a much broader range of public locations that previously could not be served practically or economically. The simple installation of an inexpensive access point device and a high-speed connection instantly creates a “wireless for-pay” network fully supported by hereUare’s services.

Professional Services: As an extension to our core products and managed services, hereUare's Professional Services staff provides complete network design, site surveys, installation, integration and network configuration.

hereUare provides users with a wireless broadband Internet access solution at half the cost of traditional wired broadband solutions, comprising of hardware, software, installation and management services. Students and Enterprise users can now increase their productivity by accessing the Internet in any location and use additional Internet services, such as email, specialized web applications, that are location specific to the school or business.

hereUare's solution extends Internet access to "unwired" areas, such as playgrounds, cafeterias, lobbies, and places where users may gather to do their work. In conclusion, hereUare's Enterprise Solution increases productivity and adds a significant value to the environment.
